3 Essay

4 Treatments

5 Climate Knowledge

6 Climate Attitudes

7 Policy 1: Emission Limit for Cars

8 Policy 2: Green Infrastructure Program

9 Policy 3: Carbon Tax with Cash Transfers

10 Comparison across the 3 Policies:

11 Preferences for Climate Policies

12 Willingness to Pay

13 International Burden-Sharing

14 Housing/Preferences for Bans vs. Incentives

15 Trust and institutions

16 Political Views

17 Feedback

18 Heterogeneity Analysis

■ Republican vs. Democrat

■ Low-income vs. High-income

19 Treatment Effects

Education and ethnicity/race

- **Education level:** Master degree should be 13% to be representative.
- **Ethnicity/Race:** Should be 60% White, 19% Hispanic, 13% Black to be representative.

Figure 1: What is the highest level of education you have completed?

Figure 2: What race or ethnicity do you identify with? (Multiple answers are possible)

Political affiliation

- **2020 election:** Should be 34% Biden and 33% Non-voter to be representative.

Figure 3: Which candidate did you vote for in the last presidential election?

Figure 4: On economic policy matters, where do you see yourself on the liberal/conservative spectrum?

Figure 5: Live in metropolitan area, based on indicated size of town

Figure 6: Region, based on ZIP code

Gender and age

Figure 7: What is your gender?

Figure 8: How old are you?

Figure 9: What was the annual income of your household in 2019 (before withholding tax, for you and those who live with you)?

Figure 10: What is the estimated value of your assets, or the assets of your household if you are married (in U.S. dollars)? Include here all your possessions (home, car, savings, etc.) net of debt. For example, if you own a house worth \$300,000 and you have \$100,000 left to repay on your mortgage, your assets are \$200,000.

Employment and occupation

Figure 11: What is your employment status?

Figure 12: Which category best describes your main occupation (or last one if not currently employed)?

Figure 13: Have you or a member of your household been laid off or had to take a cut in your salary or wages due to the COVID-19 pandemic?

Watched climate and/or policy videos attentively

Figure 23: Number of wrong answers when answering knowledge questions about the content of the videos

- What will be the rise in global average temperature in 2100 if greenhouse gas emissions continue on their current trend?
- In the absence of ambitious action against climate change, how frequent will extreme temperatures occur across the U.S. by the end of the century?
- With a green infrastructure program, how many people could find a job in green sectors in the U.S.?
- What is the emission limit described in the video?

- People worry; knowledge is mixed.
- In line with previous research, we find that about 65% of Americans acknowledge that climate change exists and is anthropogenic.
- A majority under-estimate the stringency of needed emission reductions.
- Most people understand what activities are most polluting, except for transport where knowledge is mixed. Most struggle identifying the correct ranking of regional per capita footprint.
- Most people correctly understand that climate change will entail more natural disasters, but wrongly think that volcanic eruptions will be more frequent.
- A majority thinks that CC puts humanity at risk of extinction, which is extremely pessimistic.
- A relative majority thinks they will be personally affected by CC.

Climate change knowledge: general

Figure 24: How often do you think or talk with people about climate change?

Figure 25: In your opinion, is climate change real?

Figure 26: *If answered yes to previous question:* What part of climate change do you think is due to human activity?

Figure 27: How knowledgeable do you consider yourself about climate change?

Figure 28: Do you agree or disagree with the following statement: "Climate change is an important problem."

Climate change knowledge: general

Figure 29: Do you think that cutting global greenhouse gas emissions by half would be sufficient to eventually stop temperatures from rising? (Right answer: No)

Figure 30: Which of the following elements contribute to climate change? (Multiple answers are possible)

Climate change knowledge: GHG footprints

Figure 31: Number of errors when ranking 3 items in terms of GHG emissions for three sectors

Figure 32: Rank the U.S./China/Western Europe/India in terms of GHG emissions per capita

Correct ranking: plane>car>coach, beef>chicken>pasta, coal>gas>wind/ US>Western Europe>China>India

- Most people agree CC is a problem and ambitious policies are needed.
- People are divided between optimistic and pessimistic (regarding future standards of living, technical feasibility to stop CC, and likelihood it will happen).
- People are divided between those who foresee positive effects of climate policies and a third who foresees negative effects.
- A third of people is willing to forego some comfort, two-thirds are willing to change behavior as long as it doesn't affect their comfort and they have enough financial means.

Figure 38: To what extent are the following groups responsible for climate change in the U.S.?

Beliefs about the future

Figure 39: To what extent do you think that it is technically feasible to stop greenhouse gas emissions while maintaining satisfactory standards of living in the U.S.?

Figure 40: To what extent do you think climate change already affects or will negatively affect your personal life?

To fight climate change, car producers can be required by law to limit the average CO₂ emissions per mile of the cars they sell. This limit is lowered every year, with the possible aim that only electric or hydrogen vehicles will be sold after 2040 (at which date electricity generation is expected to be non-polluting). This policy is called an emissions limit for cars.

Figure 47: Do you agree or disagree with the following statements? An emission limit for cars would...

Figure 48: In your view, would the following groups win or lose if an emission limit for cars was implemented in the U.S.?

Fairness and support

Figure 49: Do you agree or disagree with the following statement: "An emission limit for cars is fair"?

Figure 50: Do you support or oppose an emission limit for cars?

Figure 51: Do you support or oppose an emission limit for cars where alternatives such as public transports are made available to people?

A green infrastructure program is a large public investment program, which would be financed by additional public debt, to accomplish the transition needed to cut greenhouse gases emissions. Investments would concern renewable power plants, public transportation, thermal renovation of building, and sustainable agriculture.

Figure 52: Do you agree or disagree with the following statements? A green infrastructure program would...

Figure 53: In your view, would the following groups win or lose with a green infrastructure program?

Figure 54: Do you agree or disagree with the following statement: "A green infrastructure program mainly financed by public debt is fair."

Figure 55: Do you support or oppose a green infrastructure program?

Figure 56: Until now, we have considered that a green infrastructure program would be financed by public debt, but other sources of funding are possible. What sources of funding do you find appropriate for a green infrastructure program? (Multiple answers are possible)

To fight climate change, the U.S. federal government can make greenhouse gas emissions costly, to make people and firms change their equipment and reduce their emissions. The government could do this through a policy called a carbon tax with cash transfers. Under such a policy, the government would tax all products that emit greenhouse gas. For example, the price of gasoline would increase by 40 cents per gallon. To compensate households for the price increases, the revenues from the carbon tax would be redistributed to all households, regardless of their income. Each adult would thus receive \$600 per year.

Figure 57: Do you agree or disagree with the following statements? A carbon tax with cash transfers would...

Figure 58: In your view, would the following groups win or lose under a carbon tax with cash transfers?

Figure 59: Do you agree or disagree with the following statement: "A carbon tax with cash transfers is fair."

Preferences for climate policies: summary

- Each specific policy proposed gathers a majority, the most favored being an emission limit for cars.
- People are divided regarding the properties of these policies, although most think that a green infrastructure program and an emission limit for cars would be cost-effective to fight CC.
- A majority supports each climate policy proposed (including coercive measures such as mandatory insulation of buildings) except tax policies.
- The results regarding taxes go in the other direction than the first two pilots (maybe because of the more accurate level of taxes mentioned).
- Earmarking carbon tax revenues to green investments is the preferred option while uses of revenue for firms are the least favored.
- WTP to halt climate change is higher in this pilot (median at \$50/year) than in previous waves \$18/year, but is still low.
- However, the median amount people are willing to donate to a charity is \$21 (over a potential gain of \$100).
- Most people are willing to insulate or replace heating of their accommodation, the cost of doing so is the bigger obstacle.

Figure 71: Do you support or oppose the following climate policies?

Revenue recycling of carbon tax

Figure 72: Governments can use the revenues from carbon taxes in different ways. Would you support or oppose introducing a carbon tax that would raise gasoline prices by 40 cents per gallon, if the government used this revenue to finance...

International burden-sharing: summary

- The majority thinks that the U.S. should do more whether other countries do more or less.
- The favored burden sharing is the polluter-pays principle, although principles attributing a higher burden on high-income countries receive a relative majority support.
- A solid majority supports global policies, in particular a global democratic assembly on CC, and a global tax on millionaires to finance low-income countries that comply with international standards regarding climate action.

Governance of climate policies

Figure 75: At which level(s) do you think public policies to tackle climate change need to be put in place?
(Multiple answers are possible)

US climate policy

Figure 76: Do you agree or disagree with the following statement: "The U.S. should take measures to fight climate change."

Figure 77: How should U.S. climate policies depend on what other countries do?

Figure 78: To achieve a given reduction of greenhouse gas emissions globally, costly investments are needed. Ideally, how should countries bear the costs of fighting climate change?

Figure 79: Do you support or oppose the following policies?

Insulation

Figure 80: How likely is it that you will improve the insulation or replace the heating system of your accommodation over the next 5 years?

Figure 81: What are the main hurdles preventing you from improving the insulation or replace the heating system of your accommodation? (Multiple answers are possible)

Figure 82: *i)* To reduce fuel consumption for heating and cooling, the U.S. federal government could subsidize half of the costs to renovate the insulation of residential buildings to meet a certain energy efficiency standard. *ii)* Imagine that the U.S. federal government makes it mandatory for all residential buildings to have insulation that meets a certain energy efficiency standard before 2040. The government would subsidize half of the insulation costs to help households with the transition.

Do you support or oppose such a policy?

Cattle products

Figure 83: Imagine that, in order to fight climate change, the U.S. federal government decides to limit the consumption of cattle products like beef and dairy. Do you support or oppose the following options?

Treatment effects: summary

- When the treatments have some positive effects on general attitudes towards CC, they are positive.
- In particular, all treatments are associated with the belief that CC can cause the extinction of human kind.
- The Climate treatment has a positive effect on belief that CC is anthropogenic.
- The Policy treatment has a positive effect on support for a carbon tax with transfers, which can be linked to its effect on fairness and incidence on poor for this policy.
- Null treatment effects may also be the result of respondents not updating the information on the policies (emission limit for cars and green infrastructure program), or due to lack of attentiveness to the videos (knowledge score on the videos seem low).

Table 1: Attitudes towards Climate Change

	CC caused by humans	CC likely to cause extinction	Donation (in \$)	US should fight CC	Willing to limit driving
Control group mean	0.533	0.433	40.133	0.667	0.267
Treatment: Climate	0.126 (0.113)	0.158 (0.135)	-9.304 (10.409)	0.094 (0.109)	-0.032 (0.129)
Treatment: Policy	0.252** (0.121)	0.086 (0.144)	6.555 (11.088)	0.035 (0.116)	0.049 (0.137)
Treatment: Both	0.126 (0.116)	-0.007 (0.138)	-0.528 (10.629)	-0.101 (0.111)	0.161 (0.131)
Observations	112	112	112	112	112

Note: The *CC caused by humans* indicator variable equals one if the respondent thinks a lot or most of climate change is due to human actions. The *CC likely to cause extinction* indicator variable equals one if the respondent thinks climate change is somewhat likely or very likely to cause the extinction of humankind if nothing is done to limit it. The *Donation* variable is a continuous variable equal to the amount the respondent is willing to give to a charity. The *Ambitious policies needed* indicator variable equals one if the respondent thinks policy must be a lot or a great deal ambitious in order to halt climate change. The *Willing to limit driving* indicator variable equals one if the respondent is willing a lot or a great deal to limit driving. The three *treatment* indicator variables indicate difference in mean compared to the control group (people who did not see any video). Controls include socio-demographic, economic affiliation, last vote and whether the respondent's household was hit by the COVID-19 pandemic. Standard errors are in parentheses.

*p<0.1; **p<0.05; ***p<0.01

Table 2: Support for policies

	Support			
	Carbon tax with transfers	Green Infrastructure Program	Emission standard for cars	Average over 3 policies
Control group mean	0.333	0.467	0.433	0.433
Treatment: Climate	0.167 (0.117)	0.201* (0.110)	0.133 (0.114)	0.279*** (0.104)
Treatment: Policy	0.243* (0.124)	0.277** (0.117)	0.016 (0.122)	0.244** (0.111)
Treatment: Both	0.152 (0.119)	0.083 (0.112)	0.030 (0.117)	0.172 (0.107)
Observations	112	112	112	112

Note: The dependent variables are indicator variables equal to one if the respondent 'Strongly supports' or "Somewhat supports" the policy. The *Average over 3 policies* takes the average of the respondent's answers for the three policies. It equals one if the respondent support all three policies, 2/3 if she supports two, 1/3 if she support only one, and 0 if she supports none.

See notes under previous Table for a description of the covariates.

Controls include socio-demographic, economic affiliation, last vote and whether the respondent's household was hit by the COVID-19 pandemic. Standard errors are in parentheses. * $p < 0.1$; ** $p < 0.05$; *** $p < 0.01$

Table 3: Attitudes towards policies

	Fair	HH would win	Poor would win	Large economic effect	Negative economic effect
Control group mean	0.433	0.3	0.2	0.533	0.467
Treatment: Climate	0.164 (0.118)	0.117 (0.124)	0.117 (0.128)	0.041 (0.153)	-0.159 (0.140)
Treatment: Policy	0.199 (0.126)	0.101 (0.133)	0.275** (0.137)	0.083 (0.163)	0.046 (0.149)
Treatment: Both	0.081 (0.121)	0.078 (0.125)	0.219* (0.131)	0.140 (0.157)	0.007 (0.143)
Observations	112	104	111	112	112

Note: The dependent variables are discrete variables equal either to 0, 1/3, 2/3, or 1. They are equal to the average over the three policies mentioned in Table "Support policies". The *Fair* variable equals one if the respondent strongly agrees or somewhat agrees that each of the three policies are fair. The *HH/Poor would win* variables equal one if the respondent thinks her household/the poorest would win a lot or mostly win from the three policies. The *Large/Negative economic effect* variables equal one if the respondent strongly agrees or somewhat agrees that the three policies would have a large/negative impact on the U.S. economy and employment.

Controls include socio-demographic, economic affiliation, last vote and whether the respondent's household was hit by the COVID-19 pandemic.

Standard errors are in parentheses. * $p < 0.1$; ** $p < 0.05$; *** $p < 0.01$
