

Climate survey - US

OECD

Results for the US: sample of 2,010 respondents representative along the gender, age, income, region and rural/urban dimensions but not representative along the education, ethnicity/race, vote and occupation dimensions.

May 2021

Key findings

- People worry about the negative impacts of climate change; Knowledge of climate change related impacts is relatively good.
- Most people agree that CC is a problem and that ambitious policies are needed.
- A majority under-estimate the necessary policy stringency to reduce emissions.
- Two-thirds are willing to change their behavior as long as it doesn't affect their comfort and they have enough financial means (one-third is willing to forego some comfort).
- Support for our three specific policies is mixed, lower than in the pilot.
- The policy treatment increases public support for carbon tax and the ban on combustion-engine cars.

- People worry; knowledge is mixed.
- In line with previous research, we find that about 60% of Americans acknowledge that climate change exists and is anthropogenic.
- A majority under-estimate the stringency of needed emission reductions.
- Most people understand what activities are most polluting, except for transport where knowledge is mixed. Most struggle identifying the correct ranking of regional per capita footprint.
- Most people correctly understand that climate change will entail more natural disasters, but wrongly think that volcanic eruptions will be more frequent.
- A majority thinks that CC puts humanity at risk of extinction, which is extremely pessimistic.
- A relative majority thinks they will be personally affected by CC.

- Most people agree CC is a problem and ambitious policies are needed.
- People are divided between optimistic and pessimistic (regarding future standards of living, technical feasibility to stop CC, and likelihood it will happen).
- People are divided between those who foresee positive effects of climate policies and a third who foresees negative effects.
- A third of people is willing to forego some comfort, two-thirds are willing to change behavior as long as it doesn't affect their comfort and they have enough financial means.

Policy description

To fight climate change, car producers can be required by law to produce cars that emit less CO₂ per mile of the cars they sell. The emission limit is lowered every year so that only electric or hydrogen vehicles can be sold after 2030. This policy is called a *ban on combustion-engine cars*.

Effects of the policy

Figure 49: Do you agree or disagree with the following statements? A ban on combustion-engine cars would...

Figure 50: In your view, would the following groups win or lose if a ban on combustion-engine cars was implemented in the U.S.?

Figure 51: Do you agree or disagree with the following statement: "A ban on combustion-engine cars is fair"?

Figure 52: Do you support or oppose a ban on combustion-engine cars?

Support decreased from 61% in pilot, where it concerned "an emission limit for cars".

Figure 53: Do you support or oppose a ban on combustion-engine cars where alternatives such as public transports are made available to people?

A green infrastructure program is a large public investment program, which would be financed by additional public debt, to accomplish the transition needed to cut greenhouse gases emissions. Investments would concern renewable power plants, public transportation, thermal renovation of building, and sustainable agriculture.

Problem: strong acquiescence bias. In the pilot, 57% agreed that it was “cost-effective”. Formulation changed to “costly” and 54% agree.

Figure 54: Do you agree or disagree with the following statements? A green infrastructure program would...

Figure 55: In your view, would the following groups win or lose with a green infrastructure program?

Fairness and support

Figure 56: Do you agree or disagree with the following statement: "A green infrastructure program mainly financed by public debt is fair."

Figure 57: Do you support or oppose a green infrastructure program?

Support decreased from 69% in pilot.

Figure 58: Until now, we have considered that a green infrastructure program would be financed by public debt, but other sources of funding are possible. What sources of funding do you find appropriate for a green infrastructure program? (Multiple answers are possible)

To fight climate change, the U.S. federal government can make greenhouse gas emissions costly, to make people and firms change their equipment and reduce their emissions. The government could do this through a policy called a carbon tax with cash transfers. Under such a policy, the government would tax all products that emit greenhouse gas. For example, the price of gasoline would increase by 40 cents per gallon. To compensate households for the price increases, the revenues from the carbon tax would be redistributed to all households, regardless of their income. Each adult would thus receive \$600 per year.

Effects of the policy

Problem: strong acquiescence bias. In the pilot, 53% agreed that it was “cost-effective”. Formulation changed to “costly” and 55% agree.

Figure 59: Do you agree or disagree with the following statements? A carbon tax with cash transfers would...

Preferences for climate policies: summary

- Each specific policy proposed gathers more support than opposition but the only one with more “Strongly support” than “Strongly oppose” is the green infrastructure program.
- People are divided regarding the properties of these policies, and the answers may suffer from acquiescence or other bias.
- A majority supports each climate policy proposed (including coercive measures such as mandatory insulation of buildings) except tax policies and policies against meat.
- Earmarking carbon tax revenues to green investments is the preferred option while uses of revenue for firms are the least favored.
- A majority is willing to pay \$100/year to halt climate change, which is higher than the pilot' median at \$50/year (before we switched to binary question), but is still low.
- However, the median amount people are willing to donate to a charity is \$25 (over a potential gain of \$100).
- Most people are willing to insulate or replace heating of their accommodation, the cost of doing so is the bigger obstacle.

Figure 73: Do you support or oppose the following climate policies?

Revenue recycling of carbon tax

Figure 74: Governments can use the revenues from carbon taxes in different ways. Would you support or oppose introducing a carbon tax that would raise gasoline prices by 40 cents per gallon, if the government used this revenue to finance...

Figure 75: To fight global warming, the U.S. federal government could implement a policy package to reduce emissions, for example by investing in clean technologies (renewable energy, electric vehicles, public transport, more efficient insulation, etc.).

The funding for these investments could be collected annually through an additional individual contribution for the foreseeable future. Assume that everyone in the U.S. as well as citizens of other countries would be required to contribute according to their means.

Are you willing to pay [amount] annually through an additional individual contribution to limit global warming to safe levels (less than 3.6 degrees Fahrenheit)?

Figure 76: By taking this survey, you are entered into a lottery to win \$100. You can also donate a part of this additional compensation (should you be selected in the lottery) to a reforestation project through the charity The Gold Standard. If you win the \$100 lottery, how much will you donate to the Gold Standard charity?

We have a winner who decided to donate the \$100 prize.

International burden-sharing: summary

- The majority thinks that the U.S. should do more whether other countries do more or less.
- The favored burden sharing is the polluter-pays principle, although principles attributing a higher burden on high-income countries receive a relative majority support.
- A solid majority supports global policies, in particular a global democratic assembly on CC, and a global tax on millionaires to finance low-income countries that comply with international standards regarding climate action.

Governance of climate policies

Treatment effects: summary

- When the treatments have almost no effect on general attitudes towards CC.
- The Policy treatment has a large positive effect on support for a carbon tax with transfers (+13 p.p.), which can be linked to its effect on fairness and incidence on poor for this policy.
- The Policy treatment also has a positive effect on support for the ban on combustion-engine (7 p.p.).
- The Climate treatment has a negative effect on willingness to limit driving and support for green infrastructure program, which might be spurious correlation.
- Low or null treatment effects may also be the result of respondents not updating the information on the policies (ban of combustion-engine cars and green infrastructure program), or due to lack of attentiveness to the videos (knowledge score on the videos seem low).

Table 1: Attitudes towards Climate Change

	CC caused by humans	CC likely to cause extinction	Donation (in \$)	US should fight CC	Willing to limit driving
Control group mean	0.627	0.56	36.974	0.724	0.317
Treatment: Climate	0.009 (0.027)	-0.026 (0.029)	3.797* (2.065)	0.022 (0.025)	-0.049* (0.028)
Treatment: Policy	-0.019 (0.026)	-0.014 (0.028)	-0.276 (2.026)	-0.012 (0.025)	0.037 (0.027)
Treatment: Both	0.046* (0.027)	-0.003 (0.029)	7.243*** (2.112)	-0.004 (0.026)	0.021 (0.028)
Observations	2,000	2,004	2,004	2,004	2,004

Note: The *CC caused by humans* indicator variable equals one if the respondent thinks a lot or most of climate change is due to human actions. The *CC likely to cause extinction* indicator variable equals one if the respondent thinks climate change is somewhat likely or very likely to cause the extinction of humankind if nothing is done to limit it. The *Donation* variable is a continuous variable equal to the amount the respondent is willing to give to a charity. The *Ambitious policies needed* indicator variable equals one if the respondent thinks policy must be a lot or a great deal ambitious in order to halt climate change. The *Willing to limit driving* indicator variable equals one if the respondent is willing a lot or a great deal to limit driving. The three *treatment* indicator variables indicate difference in mean compared to the control group (people who did not see any video). Controls include socio-demographic, economic affiliation, last vote and whether the respondent's household was hit by the COVID-19 pandemic. Standard errors are in parentheses.

*p<0.1; **p<0.05; ***p<0.01

Table 2: Support for policies

	Support			
	Carbon tax with transfers	Green Infrastructure Program	Ban on combustion-engine cars	Average over 3 policies
Control group mean	0.318	0.518	0.411	0.496
Treatment: Climate	0.043 (0.027)	−0.039 (0.028)	0.030 (0.028)	0.032 (0.027)
Treatment: Policy	0.126*** (0.027)	0.017 (0.027)	0.066** (0.027)	0.057** (0.027)
Treatment: Both	0.131*** (0.028)	0.053* (0.028)	0.039 (0.028)	0.081*** (0.028)
Observations	2,004	2,004	2,004	2,004

Note: The dependent variables are indicator variables equal to one if the respondent ‘Strongly supports’ or ‘Somewhat supports’ the policy. The *Average over 3 policies* takes the average of the respondent’s answers for the three policies. It equals one if the respondent support all three policies, 2/3 if she supports two, 1/3 if she support only one, and 0 if she supports none.

See notes under previous Table for a description of the covariates.

Controls include socio-demographic, economic affiliation, last vote and whether the respondent’s household was hit by the COVID-19 pandemic. Standard errors are in parentheses. *p<0.1; **p<0.05; ***p<0.01

Table 3: Attitudes towards policies

	Fair	HH would win	Poor would win	Large economic effect	Negative economic effect
Control group mean	0.474	0.314	0.251	0.689	0.523
Treatment: Climate	0.052* (0.028)	-0.0003 (0.028)	-0.014 (0.027)	-0.051* (0.028)	-0.050* (0.029)
Treatment: Policy	0.065** (0.027)	0.060** (0.028)	0.150*** (0.027)	0.023 (0.028)	-0.031 (0.029)
Treatment: Both	0.071** (0.028)	0.106*** (0.029)	0.167*** (0.028)	0.006 (0.029)	0.026 (0.030)
Observations	2,004	1,894	1,979	2,004	2,004

Note: The dependent variables are discrete variables equal either to 0, 1/3, 2/3, or 1. They are equal to the average over the three policies mentioned in Table "Support policies". The *Fair* variable equals one if the respondent strongly agrees or somewhat agrees that each of the three policies are fair. The *HH/Poor would win* variables equal one if the respondent thinks her household/the poorest would win a lot or mostly win from the three policies. The *Large/Negative economic effect* variables equal one if the respondent strongly agrees or somewhat agrees that the three policies would have a large/negative impact on the U.S. economy and employment.

Controls include socio-demographic, economic affiliation, last vote and whether the respondent's household was hit by the COVID-19 pandemic.

Standard errors are in parentheses. * $p < 0.1$; ** $p < 0.05$; *** $p < 0.01$

Descriptions of Indexes

- Indexes are non-weighted average of z-scores
- Each z-score is normalized with survey weights, control mean group and sd mean group. Impute mean of treatment group to missing values.
- *Affected Index*: polluting sector, transports used, expenses in gas and heating, availability of public transport, size of town, urbanity.
- *Knowledge Index*: scores on footprint questions, knowledge on the dynamic, reality, and anthropogenic diemsnions of climate change, knowledge of the impacts origins of climate change.
- *Knowledge Index (EFA)*: weights are loadings from explanatory factor analysis.
