Note: The *race: White only* indicator variable equals one if the respondent's self reported race is only "White". The regression includes controls for gender, having children and having completed a college degree. The three *status* indicator variables indicate the difference in mean compared to a reference group of people not working (either unemployed or inactive). The *status: Working* indicator variable includes respondents who self-reported being either "Full-time employed", "Part-time employed", or "Self-employed". The three *Income* indicator variables indicate difference in mean compared to a reference group of people in the first quartile of household's annual income in 2019 (income < \$35,000). The two *age* indicator variables indicate difference in mean compared to a reference group of people aged between 18 and 29. The two *vote* indicator variables indicate difference in mean compared to a reference group of people who either did not vote in the 2020 Presidential election or voted for another candidate than Biden or Trump.
