Observations	2,010	2,010	2,010	2,010				

Note: The dependent variables are indicator variables. The Interest in politics variable equals one if the respondent is interested in politics "A lot" or "A great deal." The Environmental org. member variable equals one if the respondent is a member of an environmental organization, the Relative is environmentalist variable equals one if the respondent has any relatives who are environmentalists, and the Econ. Conservative variable equals one if the respondent is "Conservative" or "Very conservative" on economic policy matters. The race: White only indicator variable equals one if the respondent's self reported race is only "White." The regression includes controls for gender, having children and having completed a college degree. The three status indicator variables indicate the difference in mean compared to a reference group of people not working (either unemployed or inactive). The status: Working indicator variable includes respondents who self-reported being either "Full-time employed", "Part-time employed", or "Self-employed". The three Income indicator variables indicate difference in mean compared to a reference group of people in the first quartile of household's annual income in 2019 (i.e. income < \$35,000). The four age indicator variables indicate difference in mean compared to a reference group of people aged between 18 and 24. The two vote indicator variables include either people who actually voted for the candidate in the 2020 Presidential election or who did not vote but indicate they would have voted for this candidate. They indicate difference in mean compared to a reference group of people who voted for – or indicate they would have voted for – another candidate than Biden or Trump.

	(0.040)	(0.039)	(0.016)	(0.015)	(0.027)		
Observations	2,010	2,010	2,010	2,010	2,010		

Note: The dependent variables are indicator variables equal to one if the respondent indicates that the source of energy was her main way of heating at home. The Renewable variable corresponds to the answer "Wood, solar, geothermal, or heat pump.". The  $Heating\ expenses\ \$200+$  variable is an indicator variable equal to one if the respondent indicates paying more than USD200 per month for heating expenses. See notes under Table 1 for a description of the covariates. \*p<0.1; \*\*p<0.05; \*\*\*p<0.01

TABLE 4: CONSUMPTION AND GHG

		Own household					
	Gas expenses $$125+$	Flights (2015-19) $5+$	Often eat beef				
Mean	0.197	0.28	0.62				
Observations	2,010	2,010	2,010				

Note: The  $Gas\ expenses\ \$125+$  variable is an indicator variable equal to one if the respondent indicates spending more than USD125 per mothh for gas expenses. The  $Flights\ (2015-19)\ +5$  variable equals one if the respondent indicates having taken more than 5 round-trip flights between 2015 and 2019 included. The  $Often\ eat\ beef$  variable is an indicator variable equal to one if the respondent indicates that she eats beef weekly or daily.

Table 5: Main mode of transports used

Observations	2,010	2,010	2,010	2,010	2,010	2,010	2,010	2,010	2,010

Note: The dependent variables are indicator variables equal to one if the respondent indicates she mainly uses the mode of transport for the activity in brackets. For instance, the Car/Bike (work) variable equals one if the respondent mainly uses a car or a motorbike to go to work, school of university. Public variables stand for "Public Transports", Bicycle/Walk stands for "Walking or cycling", shop for "Grocery shopping" and leisure for "Leisure (excluding holidays)." See note under Table 1 for a description of the covariates. PT not available is an indicator variable equal to 1, if the availability of public transports where the respondent lives is "Very poor" or "Poor." p<0.1; \*\*p<0.05; \*\*\*p<0.05;

## 2 Post-treatment

## 2.1 Climate change (knowledge)

Table 6: Talks often about climate change

	Never	Yearly	Monthly
Mean	0.43	0.384	0.186
Observations	2,010	2,010	2,010

Note: The variables are indicator variables. For instance, Never equals one if the respondent never talks about climate change.

TABLE 7: CLIMATE CHANGE EXISTENCE

	is real	mostly due to human activity	important problem	knowledgeable

Note: The dependent variables are indicator variables. The *is real* variable equals one if the respondent believes climate change is real. The *mostly due to human activity* variable equals one if the respondent thinks "A lot" or "Most" of climate change is due to human activity. The *important problem* variable equals one if the respondent "Agrees" or "Strongly agress" that climate change is an important problem. The *knowledgeable* variable equals one if the respondent consider herself "A lot" or "A great deal" knowledgeable about climate change. See note under Table 1 for a description of the covariates. The three *treatment* indicator variables indicate difference in mean compared to the control group (people who did not see any video).

Note: The score GHG variable is a discrete variable in [0;4] reflecting knowledge about greenhouse gases: the higher the more knowledgeable. The not sufficient to halve GHG is an indicator variable equal to one if the respondent thinks that cutting global greenhouse gas emissions by half would not be sufficient to stop temperatures from rising. The score impact variable is a discrete variable in [0;4] reflecting knowledge about the impacts of climate change: the higher the more knowledgeable. See notes under Table 1 and Table 7 for a description of the covariates.

Note: The variables are discrete variables in [0;3] for score transport, score food and score electricity, and in [0;6] for score region emissions and score per capita emissions. The variables are Kendall tau distances and reflect the number of errors when ranking items in terms of greenhouse gases emissions: the higher, the more wrong answers. For instance, a score food of two means that the respondent's ranking of a beef steak, a serving of pasta or chicken wings in terms of greenhouse gas emissions is two swaps away from the actual ranking. See notes under Table 1 and Table 7 for a description of the covariates. \*p<0.1; \*\*p<0.05; \*\*\*p<0.01

Note: The dependent variables are indicator variables. The *Technically feasible* variable equals one if the respondent thinks it is "A lot" or "A great deal" technically feasible to stop greenhouse gas emissions by the end of the century while maintaining satisfactory standards of living in the U.S.. The *Affected personally* variable equals one if the respondents thinks that climate change already affects or will affect her personal life negatively "A lot" or "A great deal". The *Halt by end of century* variable equals one if the respondent thinks it is "Somewhat likely" or "Very likely" that human kind halts climate change by the end of the century. The *Positive effects on the economy* variable equals one if the respondent thinks that if we decide to halt climate change through ambitious policies, there would be "Positive" or "Very positive" effects on the U.S economy and employment. The *Negative effects personally* variable equals one if the respondent thinks that if we decide to halt climate change through ambitious policies, it would negatively affect "A lot" or "A great deal" her lifestyle. See notes under Table 1 and Table 7 for a description of the covariates.

Observations	2,010	2,010	2,010	2,010	2,010		

Note: The dependent variables are indicator variables equal to one if the respondent "Somewhat agrees" or "Strongly agrees" with the proposition. For instance, the *Reduce car emissions* variable equals one if the respondent "Somewhat agrees" or "Strongly agrees" with the fact that a ban on combustion engine cars would reduce  $CO_2$  emissions from cars. The *Reduce pollution* variable corresponds to the proposition that a ban on combustion engine cars would reduce air pollution. The *Negative effect* variable corresponds to the proposition that a ban on combustion engine cars would have negative effect on the U.S. economy and employment. The *Large effect* variable corresponds to the proposition that a ban on combustion engine cars would have a large effect on the U.S. economy and employment. The *Costly* variable corresponds to the proposition that a ban on combustion engine cars would be a costly way to fight climate change. See notes under Table 1 and Table 7 for a description of the covariates.

Note: The dependent variables are indicator variables equal to one if the respondent thinks the category would "Mostly lose' or "Lose a lot" from a ban on combustion engine cars policy. For instance, the variable *Poorest* equals one if the respondent thinks the poorest would "Mostly lose" or "Lose a lot" if such a policy was implemented. See notes under Table 1 and Table 7 for a description of the covariates.

Note: The dependent variables are indicator variables. The Fair variable equals one if the respondent "Somewhat agrees" or "Strongly agrees" that a ban on combustion engine cars is fair. The Support variable equals one if the respondent "Somewhat supports" or "Strongly supports" a ban on combustion engine cars policy. The Support with alternatives variable equals one if the respondent "Somewhat supports" or "Strongly supports" a ban on combustion engine cars policy where alternatives such as public transports are made available to people. See notes under Table 1 and Table 7 for a description of the covariates. p<0.1; \*\*p<0.05; \*\*\*p<0.05

Note: The dependent variables are indicator variables equal to one if the respondent "Somewhat agrees" or "Strongly agrees" with the proposition. For instance, the *Greener electricity* variable equals one if the respondent "Somewhat agrees" or "Strongly agrees" with the fact that a green infrastructure program would make electricity production greener. The *More use of public transport* variable corresponds to the proposition that a green infrastructure program would increase the use of public transport. See notes under Table 1 and Table 7 for a description of the covariates, and notes under Table 14 for the other dependent variables.

Note: The dependent variables are indicator variables equal to one if the respondent thinks the source of funding would be appropriate to finance a green investment program. For instance, the variable  $Public\ debt$  equals one if the respondent thinks public debt would be an appropriate way to finance to a green investment program. See notes under Table 1 and Table 7 for a description of the covariates.

Note: The dependent variables are indicator variables equal to one if the respondent "Somewhat agrees" or "Strongly agrees" with the proposition. For instance, the *Drive less* variable equals one if the respondent "Somewhat agrees" or "Strongly agrees" with the fact that a carbon tax with cash transfers would encourage people to drive less. The *Insulate more* variable corresponds to the proposition that a carbon tax with cash transfers would encourage people and companies to insulate buildings. The *Reduce fossil fuels* variable corresponds to the proposition that a carbon tax with cash transfers would reduce the use of fossil fuels and greenhouse gas emissions. See notes under Table 1 and Table 7 for a description of the covariates, and notes under Table 14 for the other dependent variables.

Note: The dependent variables are indicator variables. The *Fair* variable equals one if the respondent "Somewhat agrees" or "Strongly agrees" that a carbon tax with cash transfers is fair. The *Support* variable equals one if the respondent "Somewhat supports" or "Strongly supports" a carbon tax with cash transfers. See notes under Table 1 and Table 7 for a description of the covariates.

Note: The dependent variables are indicator variables equal to one if the respondent "Somewhat supports" or "Strongly supports" the policy. For instance, *Tax on flying* equals one if the respondent supports a tax on flying. The *Technology subsidies* variable corresponds to a subsidies for low-carbon technologies (renewable energy, capture and storage of carbon...) policy. The *Global climate fund* variable corresponds to a contribution to a global climate fund to finance clean energy in low-income countries. See notes under Table 1 and Table 7 for a description of the covariates.

Note: The dependent variables are indicator variables. The *flight climate change* variable equals one if the respondent "Somewhat agrees" or "Strongly agrees" with the fact that the U.S. should take measures to fight climate change. The *be more ambitious*, *if others more* variable equals one if the respondent thinks the U.S. should do "More" or "Much more" if other countries do more. The *be more ambitious*, *if others less* variable equals one if the respondent thinks the U.S. should do "More" or "Much more" if other countries do less. See note under Table 1 and Table 7 for a description of the covariates. p<0.1; \*\*p<0.05; \*\*\*p<0.05

TABLE 33: COUNTRIES THAT SHOULD BEAR THE COSTS

			Countries should

Note: The dependent variables are indicator variables equal to one if the respondent indicates to "Somewhat agree" or "Strongly agree" to the proposition regarding how countries should bear the costs of fighting climate change. For instance, *Pay in proportion to income* equals one if the respondent agrees that all countries should pay in proportion to their income. See note under Table 1 and Table 7 for a description of the covariates.

Note: The dependent variables are indicator variables. The *Active government* variable equals one if the respondent thinks the government should do more to solve our country's problems. The *Inequality serious problem* equals one if the respondent thinks that income inequality in the U.S. is "A serious issue" or "A very serious issue." The *World poorer or same* variable equals one if the respondent indicates that in 100 years the world will be "As rich as now", "Poorer" or "Much poorer." See note under Table 1 for a description of the covariates.

Note: The dependent variables are indicator variables. The No variable equals one if the respondent does not feel that the survey was biased, the Yes, right variable equals one if the respondent feels the survey was biased towards environmental causes, the Yes, left equals one if the respondent feels the survey was biased against environment. See notes under Table 1 and Table 7 for a description of the covariates.

Note: The Affected Index variable is a summary index for being affected by climate policies. It is based on working in a polluting sector, using a car or a motorbike for transportation, gas and heating expenses, the availability of public transports, the size of town, and living in a rural area. The Knowledge Index variable is a summary index for being knowledgeable about climate policies. It is based on knowledge about emissions (for transport, electricity, food, regions, and per capita), climate change impacts, greenhouse gases, climate change dynamic, climate change being anthropogenic, climate change being real, and considering oneself knowledgeable about climate change. The Knowledge Index (EFA) variable is a summary index for being knowledgeable about climate policies with weights being loadings from explanatory factor analysis. The  $CO_2$  emissions (t/year) variable corresponds to estimated emissions from heating and gas expenses, flights and income. The standard deviation of  $CO_2$  emissions (t/year) is 6.124. The Core metropolitan variable equals one if the respondent lives in a core metropolitan area. See notes under Table 1 for a description of the covariates.
